WHAT: Learning Objectives

Over the next 30-45 minutes

- Learn about the ease of migrating to or from Splunk Cloud
- Understand how to preserve data quality when it moves between platforms
- See the cost savings that can be made within a year.

How

Two for the price of one

Consider the two scenarios as our story

Scenario One

I'm currently operating a service (let's assume a SOC) which is currently in house, but I'm thinking of migrating to managed service provider at some point in the next 24-36 months.

I need to find the cost savings on my already reducing budget, whilst also preparing to making my data available to whichever service provider takes over.

Scenario Two

I'm currently operating a cloud instance of Splunk ES but a change in regulation has altered the organisations risk profile.

I'm being asked to ensure that we have an onshore instance of the data always available to our regulator.

Placement is king

Scenario 1 & 2

Resolution

**Steps to
Resolution**

Use your own data for your data

- 
- Content
 - Quality
 - Quantity

- 
- Time spans
 - Usefulness
 - Access

- 
- Retention

Preserve Data Quality

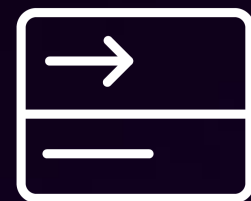

Picking the time and methods for your migration

Time Windows

Pick the appropriate duration to do the migration.

- Big Bang temptation
- Use the lifespan of 'most precious' data.

Dual Feeding Period

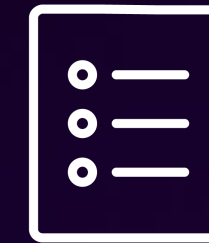

What is the smallest retention you have on high value data

Dual Feed Pre

Dual feeding isn't always dual feeding. Sending the 'same' stuff to two locations isn't always the same stuff.

You'll never verify data quality of migrated data if the data quality of dual fed data is different

Hot vs Archiving

Moving the data via events, or lifting and shifting the indexes, buckets or whatever they are in.

A data migration is not the appropriate time to

- optimise your data
- have a data clean up
- make configuration changes

Do the good stuff before for migration and then you're moving good data into a clean platform

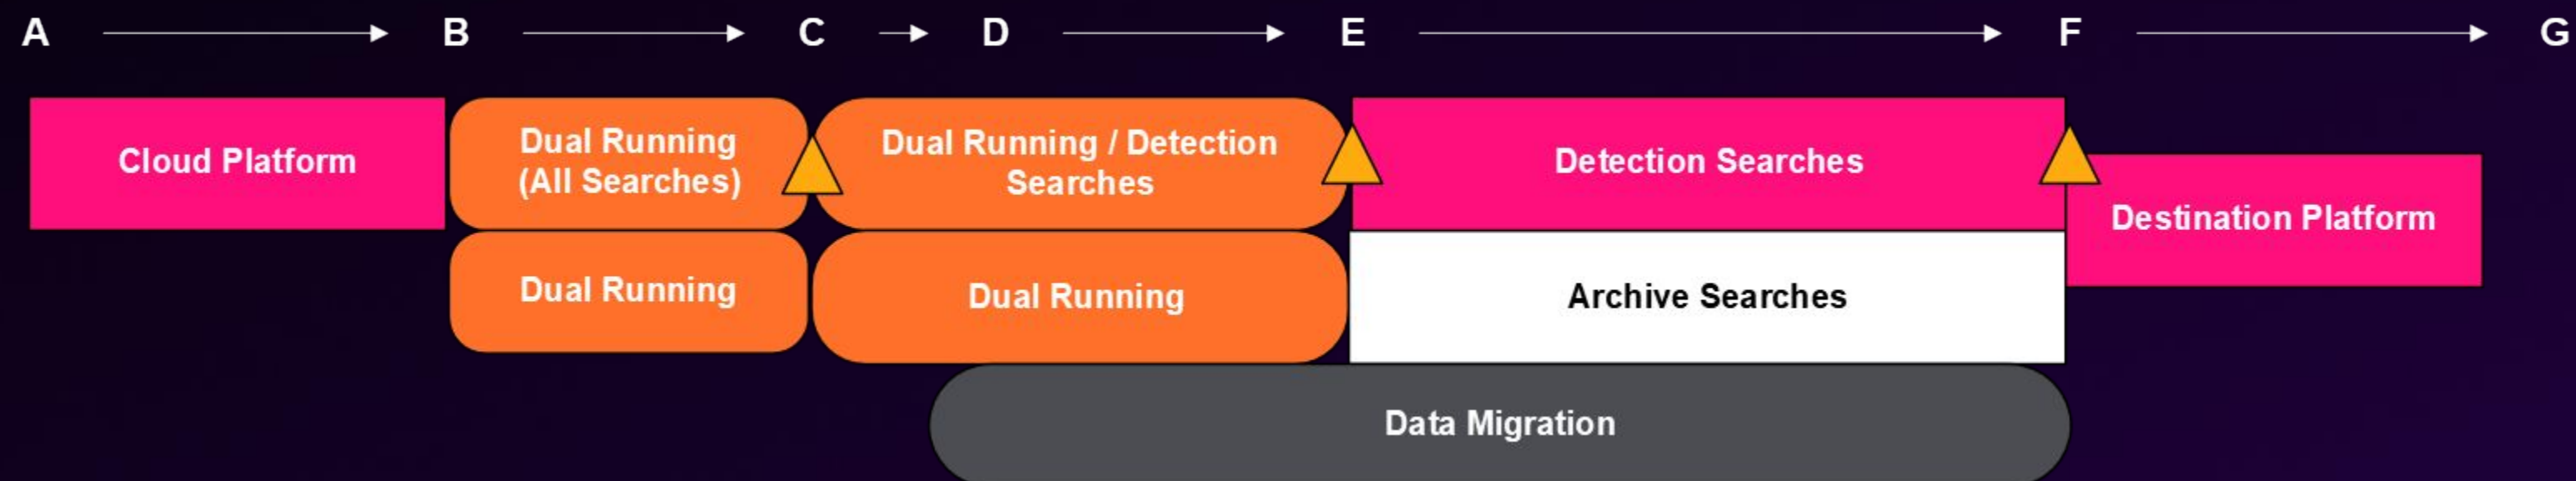

Data Migration - Scenario One

Cost savings

Where to find them

People

- Project Managers
- Splunk Engineers / Administrators
- Data analysts
- Free people up to do their day jobs !

Consolidation

- Removing complexity
- Reduction in estate
 - Remove the organic growth
 - Utilise newer / cheaper products

Storage and Processing Costs

- Appropriate Retention Periods
- Accidental indexing / ingestion of everything
- 'Do we even use this data'
- Transferring over the wrong type of network

Scenarios

- High maturity
 - Faster times, most savings
- Lower maturity
 - Longer to clean up, done whilst cheap - better service
 - Still quick, still achievable to get savings in a year
- Lowest maturity
 - Be honest, transparent and accountable

Conclusion

- Learn about the ease of migrating to or from Splunk Cloud
- Understand how to preserve data quality when it moves between platforms
- See the cost savings that can be made within a year.
